

Access network configuration technologies with the use of ICT car

[Objective] Development of advanced wireless access network and optical transmission line connection and system management/operation technology

[Summary] We have been developing the access network configuration technologies with the use of ICT car after the disaster. They include the optimum network configuration control algorithm, and wireless resource allocation algorithm which can adapt to changing communication environment. We have also been studying the optical transmission line connection technology and System management and operation technology to construct the network among ICT cars.
